論文要旨（800 字から 1200 字、英文の場合は 300 から 450 語）

This article investigates what kind of tort law is efficient within an evolutionary game. Many studies in law and economics assume agents' perfect rationality. However, the behavioral law and economics and a lot of experiments in the fields show that agents in the real world do not always behave rationally. The irrationality is quite natural property of the agents in the real world. Consequently, the outcomes of these studies are quite significant. We introduce not only the bounds of rationality, but also the evolution by natural selection into the model of tort law. This attempt clarifies the relative efficiency of various tort law systems of the real world and produces a new insight of efficient law design.
